Question 1
Correct
Mark 100 out of 100
Flag question

Status Finished
Started Thursday, 5 June 2025, 10:20 AM
Completed Thursday, 5 June 2025, 11:14 AM
Duration 54 mins 28 secs

Write a program that reads the total Students (N) and the gold (G), silver (S), and bronze (B) medals won by each student in the country. Format the output exactly as shown.

Input: 5000

Sample Output: 1500, Boys : 810, Girls : 690, Honor : 150

For example:

Input	Result
1500 Total Students : 1500, Boys : 810, Girls : 690, Honor : 150	
2000 Total Students : 2000, Boys : 1080, Girls : 920, Honor : 200	

Answer: (penalty regime: 0 %)

```
N=int(input("Total Students : "))
B=N*0.54
G=N-B-N*0.08
print("Boys : ",B," Girls : ",G,"Honor : ",N*0.08)
```

Input	Expected	Got
1500	Total Students : 1500, Boys : 810, Girls : 690, Honor : 150	Total Students : 1500, Boys : 810, Girls : 690
2000	Total Students : 2000, Boys : 1080, Girls : 920, Honor : 200	Total Students : 2000, Boys : 1080, Girls : 920

Passed all tests! ✓

Marks for this submission: 100/100.

Question 2
Correct
Mark 100 out of 100
Flag question

Ramesh's Exam salary is input through the keyboard. His dearness allowance is 40% of his basic salary, and his house rent allowance is 10% of his basic salary. Write a program to calculate his gross salary.

Sample Input:

50000

Sample Output:

90000

For example:

Input	Result
50000	90000

Answer: (penalty regime: 0 %)

```
basic=int(input())
hra=basic*0.10
da=basic*0.40
gross_salary=basic+da+hra
print(gross_salary)
```

Input	Expected	Got
50000	90000	90000.0
20000	36000	36000.0
15000	27000	27000.0
1000	1800	1800.0

Passed all tests! ✓

Marks for this submission: 100/100.

Question 3
Correct
Mark 100 out of 100
Flag question

In a logistic, the Parcels to be delivered in 4 locations (1st location 25%, 2nd location 40%, 3rd location 20% and 4th location 15%), write a program to find the total no. of parcels after the delivery in 4 locations - area (rounded) to print the no.of parcels delivered in each location.

Input:

100

output:

Total Parcels is 200

1st Location 25 parcels

2nd Location 100 parcels

3rd Location 40 parcels

4th Location 35 parcels

For example:

Input	Result
200	Total Parcels is 200 1st Location 50 parcels 2nd Location 80 parcels 3rd Location 40 parcels 4th Location 30 parcels
400	Total Parcels is 400 1st Location 100 parcels 2nd Location 160 parcels 3rd Location 80 parcels 4th Location 60 parcels

Answer: (penalty regime: 0 %)

```
N=int(input("Total Parcels is "))
P1=round(N*0.25)
P2=round(N*0.40)
P3=round(N*0.20)
P4=round(N*0.15)
print("1st Location",P1,"parcels")
print("2nd Location",P2,"parcels")
print("3rd Location",P3,"parcels")
print("4th Location",P4,"parcels")
```

Input	Expected	Got
200	Total Parcels is 200 1st Location 50 parcels 2nd Location 80 parcels 3rd Location 40 parcels 4th Location 30 parcels	Total Parcels is 200 1st Location 50 parcels 2nd Location 80 parcels 3rd Location 40 parcels 4th Location 30 parcels
400	Total Parcels is 400 1st Location 100 parcels 2nd Location 160 parcels 3rd Location 80 parcels 4th Location 60 parcels	Total Parcels is 400 1st Location 100 parcels 2nd Location 160 parcels 3rd Location 80 parcels 4th Location 60 parcels

Passed all tests! ✓

Marks for this submission: 100/100.

Question 4
Correct
Mark 100 out of 100
Flag question

Justin is a carpenter who works on an hourly basis. He works in a company where he is paid Rs 50 for an hour on weekdays and Rs 80 for an hour on weekends. Write a program to find the total salary of Justin for a week given the number of hours he worked on weekdays and weekends.

Hint:

If the final result(this) are in -ve convert that to -ve using abs() function

The abs() function returns the absolute value of the given number.

Example:

abs(num_number) = abs(number)

print(abs(-5),abs(-1.23))

Output: 5 1.23

Sample Input:

10 5

Sample Output:

weekdays 10.00

weekend 0.00

For example:

Input	Result
10 5	weekdays 10.00 weekend 0.00

Answer: (penalty regime: 0 %)

```
Salary = float(input())
if Salary < 0:
    Salary = abs(Salary) * (40) * (30)
else:
    Salary = Salary * (40) * (30)
print("weekdays {:.2f}".format(weekdays))
print("weekend {:.2f}".format(weekend))
```

Input	Expected	Got
10 5	weekdays 10.00 weekend 0.00	weekdays 10.00 weekend 0.00
5 10	weekdays 10.00 weekend 0.00	weekdays 10.00 weekend 0.00
10000	weekdays 10.00 weekend 0.00	weekdays 10.00 weekend 0.00
2700	weekdays 10.00 weekend 0.00	weekdays 10.00 weekend 0.00

Marks for this submission: 100/100.

Question 5
Correct
Mark 100 out of 100
Flag question

Write a program that returns the second last digit of the given number. Second last digit is being referred 10the digit in the tens place in the given number.

For example, if the given number is 87, the second last digit is 8.

Note1 : The second last digit should be returned as a positive number, so if the given number is -167, the second last digit is 6.

Note2 : If the given number has only one digit, consider the second last digit as 0 (since the tens place will be zero). In such cases, the program should return 0. For e.g. if the given number is 8, the second last digit should be returned as 0.

For example:

Input	Result
87	8
-167	6
8	0

Answer: (penalty regime: 0 %)

```
num = int(input())
if num < 0:
    num = -num
if num < 10:
    print(0)
else:
    print((num // 10) % 10)
```

Input	Expected	Got
87	8	8
-167	6	6
8	0	0

Question 6
Correct
Mark 100 out of 100
Flag question

Write a program to convert strings to an integer and float and display its type.

Sample Input:

10

10.5

Sample Output:

10 under Int

10.5 under Float

For example:

Input	Result
10 10.5	10 under Int 10.5 under Float
'A' 'Hai'	Error Error

Answer: (penalty regime: 0 %)

```
a=int(input())
print(a,"under Int")
b=float(input())
print(b,"under Float")
```

Input	Expected	Got
10 10.5	10 is/are 'int'. 10.5 is/are 'float'.	10 is/are 'int'. 10.5 is/are 'float'.
'A' 'Hai'	'A' is/are 'str'. 'Hai' is/are 'str'.	'A' is/are 'str'. 'Hai' is/are 'str'.
10 10.5	10 is/are 'int'. 10.5 is/are 'float'.	10 is/are 'int'. 10.5 is/are 'float'.
10 'Hai'	10 is/are 'int'. 'Hai' is/are 'str'.	10 is/are 'int'. 'Hai' is/are 'str'.
10000 'Hai'	10000 is/are 'int'. 'Hai' is/are 'str'.	10000 is/are 'int'. 'Hai' is/are 'str'.
2500 2500.2500	2500 is/are 'int'. 2500.2500 is/are 'float'.	2500 is/are 'int'. 2500.2500 is/are 'float'.

Question 7
Correct
Mark 100 out of 100
Flag question

In many jurisdictions, a small deposit is added to drink containers to encourage people to recycle them. In one particular jurisdiction, drink containers holding one liter or less have a deposit of 10 cents, and containers holding more than one liter have a deposit of 25 cents. Write a program that reads the number of containers of each size from the user. Your program should continue by computing and displaying the refund that will be received for returning those containers. Format the output so that it includes a dollar sign and always displays exactly two decimal places.

Sample Input:

10

20

Sample Output:

Your total refund will be $8.00

For example:

Input	Result
10 20	Your total refund will be $7.00.

Answer: (penalty regime: 0 %)

```
a=int(input())
b=int(input())
print("Your total refund will be $",(a*0.10)+(b*0.25))
```

Input	Expected	Got
10 20	Your total refund will be $8.00.	Your total refund will be $8.0.
10 10	Your total refund will be $6.00.	Your total refund will be $6.0.
100 100	Your total refund will be $60.00.	Your total refund will be $60.0.
10 10	Your total refund will be $3.50.	Your total refund will be $3.5.

Question 8
Correct
Mark 100 out of 100
Flag question

You want on a tour bus to Ooty with your friends. As a part of that tour, you want traveling with them. For the bus to remain stable, the number of people on board must be restricted based on the weight of the people. You first find the maximum who is willing your trust to be more greedy of money. For saving more, he takes too many people to travel in the fuel at a time. So you want to check how many people can travel in the bus safely. Write a program that takes the weight of the driver and the weight of each passenger (including you) as input, and calculates how many passengers can be on board safely. If it's safe, print "Bus is stable, else display Bus will drown. INPUT & OUTPUT FORMAT:

Input consists of two integers.

First input corresponds to the weight that the boat can handle.

Second input corresponds to the number of adults.

Third input corresponds to the number of children.

For example:

Input	Result
100 5 5	Boat is stable
100 5 10	Boat will drown

Answer: (penalty regime: 0 %)

```
a=int(input())
b=int(input())
c=int(input())
if a>=(b+c):
    print("Boat is stable")
else:
    print("Boat will drown")
```

Input	Expected	Got
100 5 5	Boat is stable	Boat is stable
100 5 10	Boat will drown	Boat will drown

Flag question

In a lab, 90% are Dell and 30% Lenovos and 29% are Acer and 2% are Samsung. write a python code to print total systems and brand wise count in the specific format using key-value pairs.

Hint: TD

output: Total Systems:100

Dell:90

Lenovo:30

Acer:40

Samsung:2

For example:

Input	Result
100	Total Systems:100 Dell:90 Lenovo:30 Acer:40 Samsung:2
200	Total Systems:200 Dell:180 Lenovo:60 Acer:80 Samsung:4

Answer: (penalty regime: 0 %)

```
a=int(input("Total Systems:"))
print("Dell:",a*0.9)
b=a*0.3
print("Lenovo:",b)
print("Acer:",a*0.4)
c=a*0.02
print("Samsung:",c)
```

Input	Expected	Got
100	Total Systems:100 Dell:90 Lenovo:30 Acer:40 Samsung:2	Total Systems:100 Dell: 90.0 Lenovo: 30.0 Acer: 40.0 Samsung: 2.0

Marks for this submission: 100/100.

Question 10
Correct
Mark 100 out of 100
Flag question

Alfred buys an old scooter for Rs. X and spends Rs. Y on its repairs. If he sells the scooter for Rs. Z (Z>=X+Y), Write a program to help Alfred to find his profit gain. Print all the above mentioned values through the keyboard and find the gain percent.

Input Format:

The first line contains the Rs. X

The second line contains Rs.Y

The third line contains Rs. Z

Sample Input:

100

200

150.5

Sample Output:

49.5% is the gain percent.

For example:

Input	Result
100 200 150.5	49.5% is the gain percent.

Answer: (penalty regime: 0 %)

```
X = float(input())
Y = float(input())
Z = float(input())

gain_price = Z - (X + Y)
gain_percent = (gain / cost_price) * 100

print(f"{} is the gain percent.")
```

Input	Expected	Got
100 200 150.5	49.5% is the gain percent.	49.5% is the gain percent.
100 200 250	100.0% is the gain percent.	100.0% is the gain percent.
1000 2000 2500	50.0% is the gain percent.	50.0% is the gain percent.
1000 2000 2200	100.0% is the gain percent.	100.0% is the gain percent.
